Document Body

This form defines an AES Standards project, its intended aim and its expected timescale. The relevant AESSC Subcommittee is responsible for its contents and for initiating the project in the appropriate Working Group.

PIF PROPOSED BY

Name of proposer

Chris Chambers

Date of submission

2013-09-24 amended 2014-05-01

Proposed by Working Group

SC-07-01

PROJECT PROPOSAL

Provisional project ID

AES-X220 [assigned by secretariat]

Offered to Subcommittee

SC-07

Proposed title

Professional audio definition model review

Proposed scope

To review the EBU audio definition model, Tech 3364v1.0 and amend if required to fit within the existing AES60 framework standard to ensure that key items are both easily and consistently implemented.

Output intent

Standard

First draft?

EBU Tech 3364v1.0

Estimated completion date

2015

Known patents

None known

PROJECT INITIATED

Date project initiated

RATIONALE

The following section of the form is intended to set out and document the reasons for undertaking this project and the benefits anticipated from the successful publication of its output document.

The questions are discussed further at <http://www.aes.org/standards/>

The text fields will expand automatically to fit the amount you wish to write and, where appropriate, you may find it convenient to paste text from another document.

Why is this project useful?

The EBU have produced and published version 1 of their Audio Definition Model as Tech 3364. This model contains many Audio-related parameters than can be used across the wider professional audio industry. This project will study the EBU model and produce a version suitable for inclusion in the AES60 standard with amendments or additions if required to meet industries supported by the AES. Maintaining a common metadata for use across audio applications and processes would reduce the risk of incompatibility issues and improve general interoperability. Building on the existing work of AES60 and ensuring this work is fed back to the EBU would also promote wider industry interoperability.

Anticipated output

- Standard
- Information Document
- Report
- Other (please specify)

Standard as an amendment to AES60.

Who benefits?

Who will benefit from the output of this project?

tba

Related standards?

Which other standards will be directly related to this project?

AES60, SMPTE RP 210, EBU Tech 3293-v1_5

Liaisons?

Which other groups are working in this area and might be contacted to improve the outcome of this project?

SMPTE, EBU, ITU.

Alternative bodies?

Which other standards bodies would be likely to be working on this topic?

None obvious

AES advantage?

Which special attribute do you feel the AES can offer to this work?

Interoperability of professional audio is a core issue for the Audio Engineering Society

ACTION

Subcommittee
